Empathy Map

CrimeVision AI — Intelligent Multimodal Forensic Analysis Platform

Date	29 October 2026	Project Name	CrimeVision AI — Intelligent Multimodal Forensic Analysis Platform	Project Type	Individual / Solo

Purpose. This empathy map captures the likely needs and concerns of a primary CrimeVision AI user across four perspectives: says, thinks, does, and feels. It is a design hypothesis for the prototype, not a substitute for interviews or validated user research.

PRIMARY PERSONA

Forensic Investigator / Authorized Evidence Analyst

SAYS

- “I need to review large volumes of multimedia evidence efficiently.”
- “I need to know exactly where each observation came from.”
- “Other authorized reviewers must be able to understand the findings.”

THINKS

- Which files, frames, or audio segments are most relevant to this case?
- Can each AI-assisted observation be traced to its source and timestamp?
- How do I distinguish an extracted fact from a model-generated suggestion?

DOES

- Collects and organizes authorized case files and associated metadata.
- Reviews images, video, audio, and documents using available tools.
- Cross-checks candidate findings and records observations for human review.

FEELS

- Under pressure when evidence volume is high and time is limited.
- Cautious about model errors, missing context, and false associations.
- More confident when outputs are traceable, clearly explained, and verifiable.

Design implications

CrimeVision AI should prioritize source traceability, understandable explanations, timestamps/frame or page references where available, uncertainty-aware outputs, and human verification. Candidate correlations should be presented as leads for review—not as confirmed facts, proof of identity, or conclusions about guilt.

Validation note: Persona statements are proposed assumptions and should be validated with relevant users where feasible. This is an individual project; no team ID or team-member list applies.
